Introduction:

In today's digitally driven world, trip planning remains one of the most stressful and time-consuming experiences for travelers. With an overwhelming number of websites, conflicting recommendations, and countless logistical considerations, users often spend hours trying to create the perfect itinerary — only to feel uncertain about their choices.

WanderWise is an AI-powered travel planning startup designed to revolutionize this process.

Our platform uses generative AI to automatically craft personalized travel itineraries based on the user's preferences, budget, group size, and travel goals. Whether a solo backpacker or a family of four, WanderWise delivers a tailored experience that saves time, reduces costs, and maximizes travel satisfaction.

The need for intelligent travel planning has never been more urgent. According to a 2023 Expedia report, 74% of travelers feel overwhelmed by the trip planning process, and over 60% wish for an app that could handle the itinerary for them. Meanwhile, the global market for AI in travel and tourism is projected to surpass \$1.2 billion by 2026. With millions traveling each month and travel numbers climbing annually, WanderWise offers a timely and impactful solution to modern traveler pain points.

Problem Statements:

Problem 1 – Planning Fatigue & Decision Overload

Despite the abundance of travel tools and information, trip planning has become more complex than ever. On average, travelers visit 38 different websites before booking a trip. From researching destinations, comparing flights and hotels, checking visa rules, to planning activities, travelers must manually gather and evaluate information from a disconnected ecosystem of platforms.

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

This process often leads to fatigue, confusion, and abandoned plans.

A typical trip planning journey involves:

- Searching for inspiration and destinations.
- Comparing flights and dates.
- Reviewing hotel and accommodation options.
- Researching activities and locations.
- Budget calculations.
- Building a personalized itinerary.
- Booking logistics (transport, hotels, tours).
- Saving confirmations and documents.

Because this process is so overwhelming, many people either delay their trip or choose generic package tours—which often don't match what they really want.

Problem 2 – One-Size-Fits-All Experiences

Even for those who complete their planning, the result is often **generic and uninspired**. Most existing travel platforms offer limited personalization, failing to account for:

- Personal interests (e.g., hiking vs. cultural tours).
- Budget constraints.
- Group dynamics (solo, couples, families).
- Seasonal preferences (avoid crowds, weather-based planning).

While platforms may suggest "top attractions," they **lack the intelligence to craft end-to-end experiences** that are tailored to the individual.

WanderWise solves this by using generative AI to:

- Generate complete, multi-day itineraries based on user input.
- Adjust suggestions dynamically for season, weather, crowd density, and budget.
- Offer both AI-generated and fully customizable planning flows.

This ensures that **every traveler gets a meaningful, stress-free, and highly personal travel experience**.

Hypotheses:

The effectiveness and success of WanderWise as a travel planning solution depend on several key assumptions about user behavior, technology adoption, and engagement patterns. The following hypotheses are formulated to guide the development and validation of the product:

Hypotheses1: AI-generated travel plans are preferred over manual planning when users can input preferences such as interests, budget, destination, and travel dates.

Traditional travel planning is often cumbersome, involving extensive research across multiple sources. We hypothesize that when provided with a simple interface to input key parameters, users will favor AI-generated itineraries that are customized, time-efficient, and cost-aware. This preference can be validated through user testing, A/B comparisons, and engagement metrics.

Hypotheses2: Personalized itineraries significantly improve trip completion rates and overall user satisfaction.

Generic travel apps fail to consider individual preferences, leading to mismatched suggestions and frustration. We propose that AI-powered personalization—factoring in travel style, group size, seasonality, and past behavior—will increase both the likelihood of completing a planned trip and reported satisfaction post-trip. This hypothesis can be tested through surveys and behavioral analytics.

Hypotheses3: Integrating a community feature like Wander Wall enhances user engagement and app retention.

Beyond itinerary generation, WanderWise introduces Wander Wall, a social hub where users can share experiences, browse travel posts filtered by location, and interact with other travelers. We hypothesize that such community-driven content fosters a sense of belonging, increases daily active usage, and encourages repeat engagement. Metrics like session duration, return rate, and content interaction will be used to validate this.

Methods

Data Description

Data Source – Kaggle- "monthly_passengers.xlsx"

Variable	Description	Type
ISO3	Three-letter country code (ISO 3166-1 alpha-3)	String
Year	Flight Year	Integer
Month	Flight Month	Integer
Total	Total passengers on that date for that country	Integer
Domestic	Domestic passengers on that date for that country	Integer
International	International passengers on that date for that country	Integer

Data Source – Passenger_Data.xlsx (Monthly Aggregates by Country)

Variable	Description	Type
ISO3	Three-letter country code (ISO 3166-1 alpha-3)	String
Year	Flight Year	Integer
Month	Flight month as a number (1 = Jan, ..., 12 = Dec)	Integer

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Month name	Abbreviated month name (Jan, Feb, ..., Dec), derived from Month	String
Total	Total passengers (domestic + international) on that date for that country	Integer
Domestic	Number of Domestic passengers on that date for that country	Integer
International	Number of International passengers on that date for that country	Integer

Data Cleaning in Tableau Prep Builder

Clean 1

1. Change Data Types

- Total → Number (decimal)
- Total_OS → Number (decimal)
- International → Number (decimal)
- Domestic → Number (decimal)

2. Filter Out Nulls

- Exclude rows where Total is null
- Exclude rows where Domestic is null
- Exclude rows where Total_OS is null

Clean 2

Dropping unused columns- Total OS

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Output

- Write the fully cleaned passenger dataset to the target (e.g. extract, CSV, database) for downstream visualization and analysis.

Visualization

1. Domestic vs. International Travelers (USA)

Option to select any other country as well.

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Use case

- **Demand Forecasting**

Automatically adjust which segment (e.g. international) gets promotional budget or discounted fares.

- **Personalized Offer Routing**

If a customer historically books domestic trips, surface more domestic-focused package deals when domestic demand is heating up—and vice versa.

- **Capacity & Network Optimization**

Recommend new routes or extra frequencies where models see continuing international growth, flagging markets ready for expansion.

2. Top 7 Countries Travelers

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Use case

- **“Best Time to Go” Prompts**

For any destination in your top-N list, infer its peak and off-peak windows. An AI chatbot can say: “If you’re eyeing Spain, travel in July–August for the festivals, or April–May to avoid crowds and find cheaper rates.”

- **Personalized Itineraries**

Combine a user’s budget or crowd-avoidance preference with seasonality curves: e.g., suggest late-May in Italy if they want mild weather and lower prices.

- **Cross-Country Bundles**

Identify complementary seasonality profiles (e.g., when Spain is cooling off but Greece is still warm) and build multi-stop trip suggestions with optimal timing.

3. Yearly Volume vs. Seasonality (Heatmap)

Use cases

Adaptive Month Ranking

Use the cell-values as features in a recommender: let the user choose “Top 3 high-demand months” or “Top 3 off-peak months,” and auto-filter destinations accordingly.

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Context-Aware Price Alerts

When your heatmap model flags an unexpected dip (i.e., a cell far lighter than its historical neighbors), trigger an AI agent to notify users: “Airfares to Germany are unusually low this September—would you like to lock in a deal?”

Dynamic Content Generation

In your planner’s blog or chatbot, generate tailored “when should I visit...?”

Monetization:

Wander Wise is designed with a **sustainable and scalable monetization model** that aligns with modern user expectations in digital travel services. The strategy leverages a combination of **freemium tiered access**, **affiliate commissions**, and **contextual advertising** to generate revenue while maintaining accessibility for all users.

1. Freemium Tiered Model

WanderWise follows a **freemium pricing model**, providing essential features for free while offering advanced capabilities through a paid subscription. This model ensures that users can explore the core benefits of AI-driven travel planning without any financial commitment, while still providing a compelling reason to upgrade for power users.

◆ Free Plan

- Allows users to generate **up to 2 AI-powered travel itineraries per month**.
- Grants access to the **Wander Wall**, where users can read community posts, travel blogs, and location-specific recommendations.
- Users receive **basic destination and flight suggestions**, but cannot save or export itineraries.
- Ideal for casual travelers and first-time users testing the platform.

◆ Premium Plan

- Offers **unlimited AI-generated trip plans**, empowering users to experiment, iterate, and finalize travel plans without limitations.

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

- Enables users to **save, export, and edit itineraries**, making it easier to manage and reuse plans.
- Premium subscribers also receive early access to **new features**, personalized content, and exclusive travel deals.

Proposed Pricing:

\$2.99/month or \$19.99/year, offering affordable value compared to traditional travel agents or custom services.

This plan is targeted at frequent travelers, remote workers, solo adventurers, and families who value flexibility and advanced personalization.

2. Affiliate Commission Revenue

WanderWise partners with travel service providers to earn **affiliate commissions** on transactions completed through the platform. These partners include:

- **Flight aggregators** like Skyscanner and Kayak
- **Hotel booking platforms** such as Booking.com, Agoda, and Airbnb
- **Transportation services** including rental car and airport transfer providers

When users book a flight, hotel, or transportation through links embedded in the WanderWise itinerary or recommendations, the app earns a commission from the third-party provider—without increasing the cost for the user.

This model is **performance-based**, scalable, and seamlessly integrated into the user journey. It aligns user convenience with revenue generation and allows WanderWise to remain free for budget travelers while earning through backend partnerships.

3. Contextual Advertising (Free Users Only)

To further monetize free-tier users, WanderWise incorporates **lightweight, non-intrusive ads** relevant to a user's trip context. These ads appear within the app in areas like:

- The Wander Wall (community feed)
- Destination suggestion pages
- Itinerary summary screens

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Ads are tailored based on destination, travel preferences, and seasonality, offering value instead of distraction. For example, a user planning a trip to Paris in June may see ads for Eiffel Tower tours or French SIM card packages.

This ensures that **ad content remains useful and aligned** with the user experience while generating consistent ad-based revenue.

Summary

WanderWise's monetization strategy supports long-term scalability and user acquisition by:

- Encouraging **subscription upgrades** with compelling premium features.
- Generating **transactional revenue** from travel service bookings.
- Leveraging **contextual ads** for free users in a respectful, user-focused manner.

By combining **value creation with revenue diversification**, WanderWise is well-positioned to grow sustainably while delivering meaningful travel experiences to its users.

Prototype:

GROUP PROJECT REPORT

Onboarding & Authentication

Mapping: User acquisition & security

1. Login

- Fields for Email and Password with inline validation (must contain “@”, cannot be empty).
- Links below: “Sign up” (new account) and “Click here to reset password.”

2. Sign Up

- Fields: Full Name, Email (validated), Phone, Password → “Create Account.”
- Success toast screen: large checkmark + “Account Created. You can now log in.” → “Go to Login.”

3. Forgot Password

- Single-field Email form with validation → “Send reset Link.”

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

Community Feed (“Wander Wall”) & Profile/Payments

Mapping: *Social proof → friction-free payments & settings*

1. Wander Wall Feed

- a. Full-screen posts with user handle, large hero image (e.g. snowy road), caption (“Hidden gem in West Virginia...”), and heart/comment buttons.
- b. Tapping “Comment” opens an overlay chat-style thread.

2. Comment Overlay

- a. Scrollable conversation bubbles; input at bottom lets you add your own note about the spot.

3. Profile & Settings

- a. User avatar and editable name at top; tabs for Payment Details and Account.
- b. Under **Payment Details**:
 - i. “Saved Cards” (lists existing cards)
 - ii. “Add New Card”

4. Add New Card

- a. Form for Card Number, CVV, Expiry, Name on Card → “Add” → confirmation (“Card Added Successfully!!”) → returns to **Saved Cards**.

5. Account Management

- a. Links for “View/Manage Trips,” “Past Travels,” and **Change Password**.
- b. **Update Password** form → “Update” → “Password Updated Successfully!!”

CALIFORNIA STATE UNIVERSITY, LONG BEACH

Trip Planning & AI Itinerary Flow

Mapping: *Planning fatigue* → *AI-powered itinerary generation* → *save/share*

1. Home / Entry

- a. User lands on a clean home screen with two primary callouts:
 - i. “AI-Generated Trip” (airplane icon)
 - ii. “Make your own trip” (hotel-building icon)
- b. Below, a carousel of Recommended Destinations (e.g. Yosemite) invites inspiration.

CALIFORNIA STATE UNIVERSITY, LONG BEACH
IS635 – Technology and Start-ups: Application of AI and Blockchain
GROUP PROJECT REPORT

2. AI Trip Form

- a. Tapping the airplane icon opens a form:
 - i. **Destination** text field
 - ii. **Travel Dates** pickers (Depart / Return)
 - iii. **Interests** (Adventure, Culture, Relaxation, Wildlife, Food & Drinks)
 - iv. **Budget slider** (Economy ↔ Luxury)
 - v. “Got any companions?” toggle
- b. “Search” launches the AI engine.

3. AI-Generated Trip Summary

- a. **Hotels** section: top recommendations with name, nightly rate, rating.
- b. **Flights** section: key route (e.g. LAX → JFK 04/20/25) with carrier logo and a “Book Flight” button.
- c. **Places to visit** call-out with options to “Regenerate Trip” or “View Itinerary.”

4. Itinerary Detail

- a. A day-by-day list (Day 1: Beach; Day 2: Park; etc.) with times and tappable “View Details.”
- b. Bottom bar for “Save” (heart) and “Share.”

5. “Create a New Trip” (Manual) Alternative

- a. Tapping the hotel icon instead of the airplane opens the same fields (destination/dates/interests/budget/people) but leads next to:

6. “What Would You Like to Book?”

- a. Choice between “Book a flight” (airplane icon) or “Book a hotel” (house icon).

7. Flight-Only Booking

- a. List of flight options for chosen dates (e.g. LAX – ORD on 04/20/25 via Qatar, LAX – MIA via Turkish) each with “Book Flight” button.

8. Hotel-Only Booking

- a. Hotel search results: image, name (“DoubleTree by Hilton”), rate (\$234/night), amenities (wifi, parking, pets) and a “Book” button.
